

VibeCurve — Backend Architecture

Next.js 15 front end on Vercel · serverless API routes · Amazon DynamoDB single-table back end (GSI1 matching · Streams · TTL "midnight burn")

Request flow

- 1 Sign in (Google) → build permanent profile
- 2 Draw curve → POST /api/curve → Query GSI1 shape/affinity bucket
- 3 Atomic join into a room → poll GET /api/room/[id]
- 4 Chat / voice notes / WebRTC call → audio P2P, signaling via DynamoDB
- 5 Midnight: DynamoDB TTL burns the room; profile (no TTL) survives
